## AIMS AND SCOPE

This article serves in introducing the readers to the developing field of perioperative medicine. We have made an effort to come up with the latest management guidelines covering multiple subspecialties in form of a special supplement. This compendium in perioperative medicine serves as a comprehensive guide to a practicing clinician, in managing patients with various medical comorbidities undergoing surgical procedures and avoiding common pitfalls.

**“Perioperative medical care is an indispensable component of overall surgical case management, involving concerted efforts from surgeons, anesthesiologists, internists, and subspecialists alike. With increasing intricacy of the surgical procedures being performed on a spectrum of patients ranging from those in the pediatric age group to geriatric patients with multiple comorbidities, perioperative medicine is being increasingly recognized as a subspecialty unto itself ”**

# What is Preoperative Medicine?

Risk Assessment of each organ system and its' physiologic reserve to tolerate the stress of a specific surgery.

- Organ Systems:
  - Cardiovascular
  - Pulmonary
  - Neuro-cognitive
  - Hematologic
  - Renal
  - Gastrointestinal
  - Endocrine

**Surgery Stress**

**Anesthesia Stress**

**Blood Loss**

**Activation Coagulation System**

**Hemodynamic Instability**

**Catecholamine Release**

**Activation Inflammatory Cascade**

## Preoperative Consult

### History:

- HPI
- ROS
- Medications
- Allergies
- Past Medical History

### Physical Examination:

- Vital Signs, BMI, Neck circumference
- Lungs
- Cardiac: Murmurs, Gallops, JVD
- Neurocognitive

### Testing:

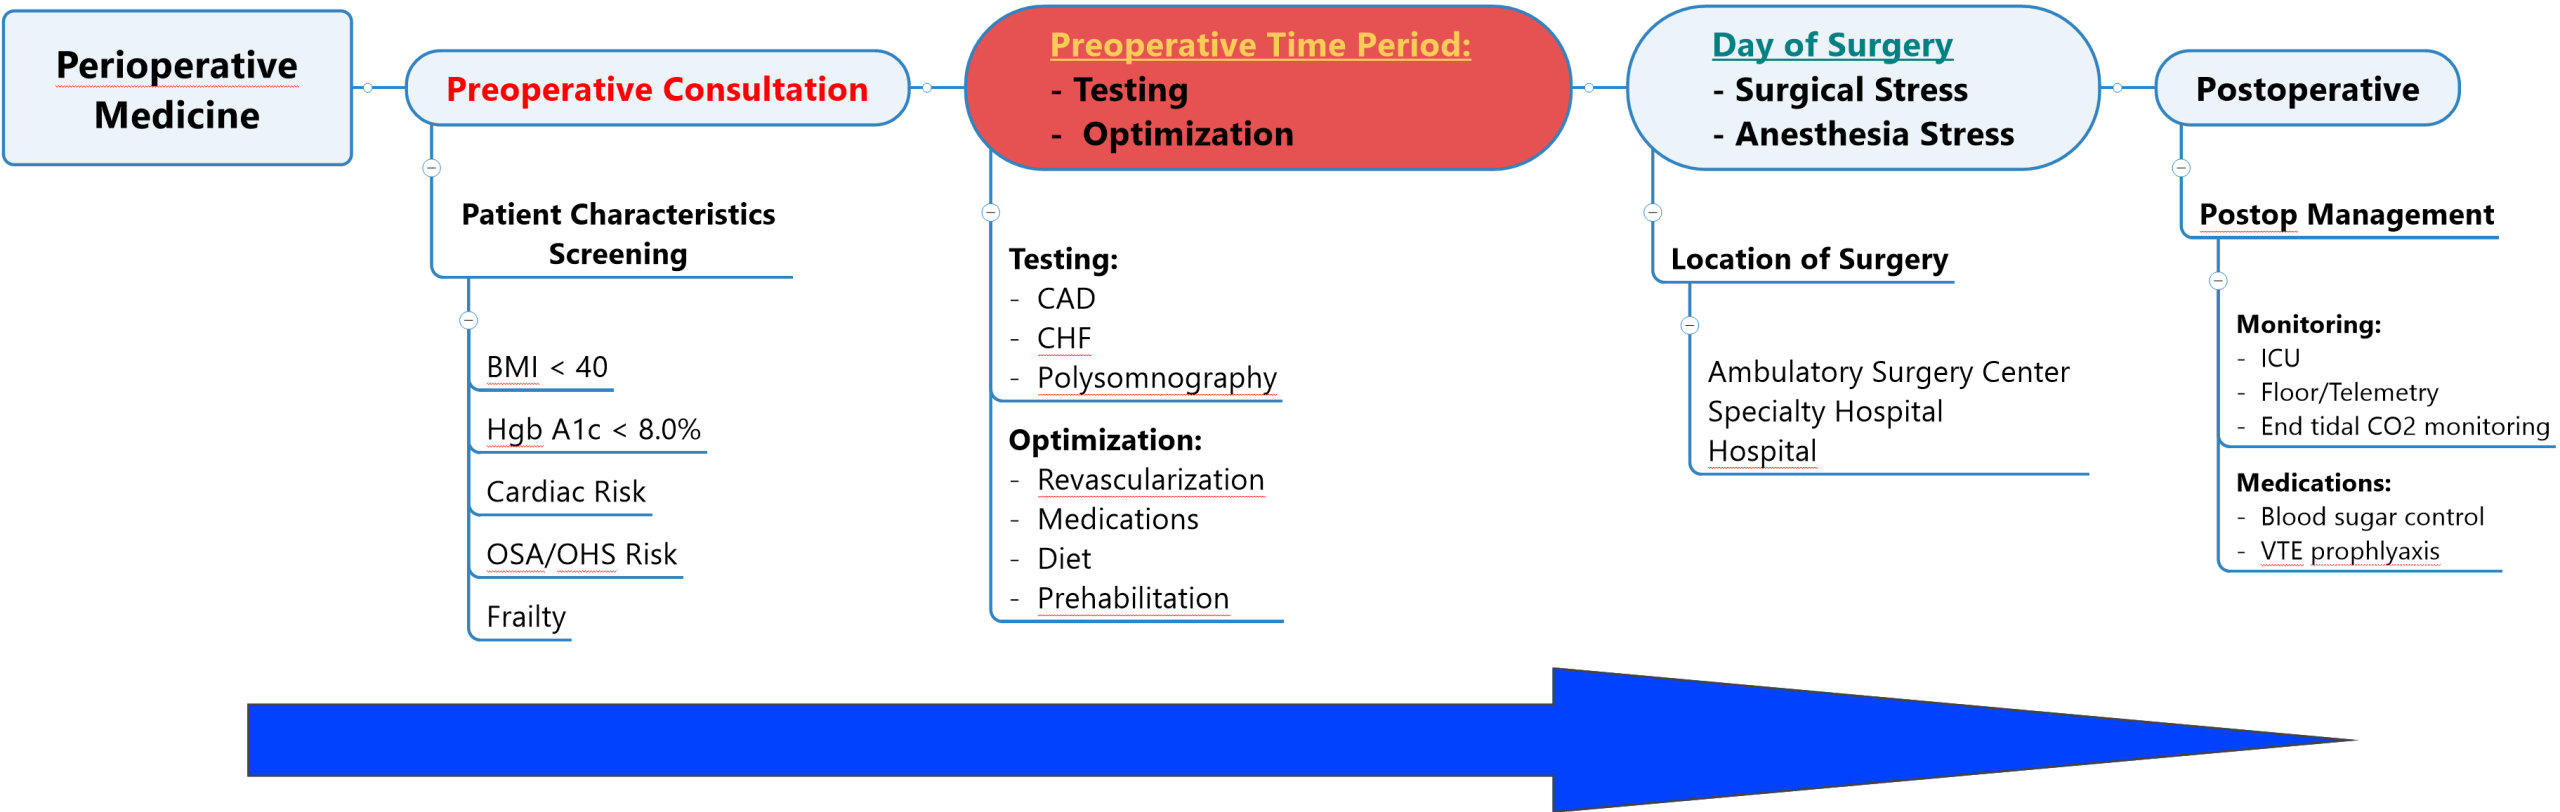

- Routine Labs
- EKG

# Preoperative Actions

## Options:

- Cancel surgery
- Postpone surgery
- Further testing to improve risk stratification accuracy
- Implement new therapeutic options:
  - Medication adjustment
  - Coronary revascularization
- Change Perioperative Locations
  - Ambulatory surgery center, Specialty Hospital, Hospital
  - Postoperative
    - ICU
    - Monitoring options
      - Telemetry, Oxygen saturation, End-Tidal CO2 monitoring

# Perioperative Time Period

# Preoperative Screening & Potential Actions

- **BMI > 40**
  - Postpone refer to weight loss program
- **Hemoglobin A1c > 8.0%**
  - Postpone and implement diabetic management program
- **High Risk OSA/OHS (STOPBANG score  $\geq$  5)/Hypercarbia**
  - Refer for Polysomnography and CPAP therapy
- **Cardiac Risk**
  - Testing for CAD

# Preoperative Cardiac Risk Evaluation and Management

# Perioperative Guidelines

- 2014 ACC/AHA Guideline
- 2014 European Society of Cardiology/European Society of Anesthesiology
- 2017 Canadian Cardiovascular Society (CCS)

# American College of Cardiology /AHA guidelines 2014

The first step of the algorithm is to determine the urgency of the surgery.

The ACC/AHA guidelines defined urgency as the need to have surgery within the following time frames:

- **Emergent** < 6 hours;
- **Urgent** 6-24 hours;
- **Time sensitive** 1-6 weeks;
- **Elective** 1 year or more.

# ACC/AHA 2014 Algorithm

**Risk of MACE > 1%**

- RCRI  $\geq 1$
- NSQIP

**Next STEP**

- Functional Status
- METS < 4

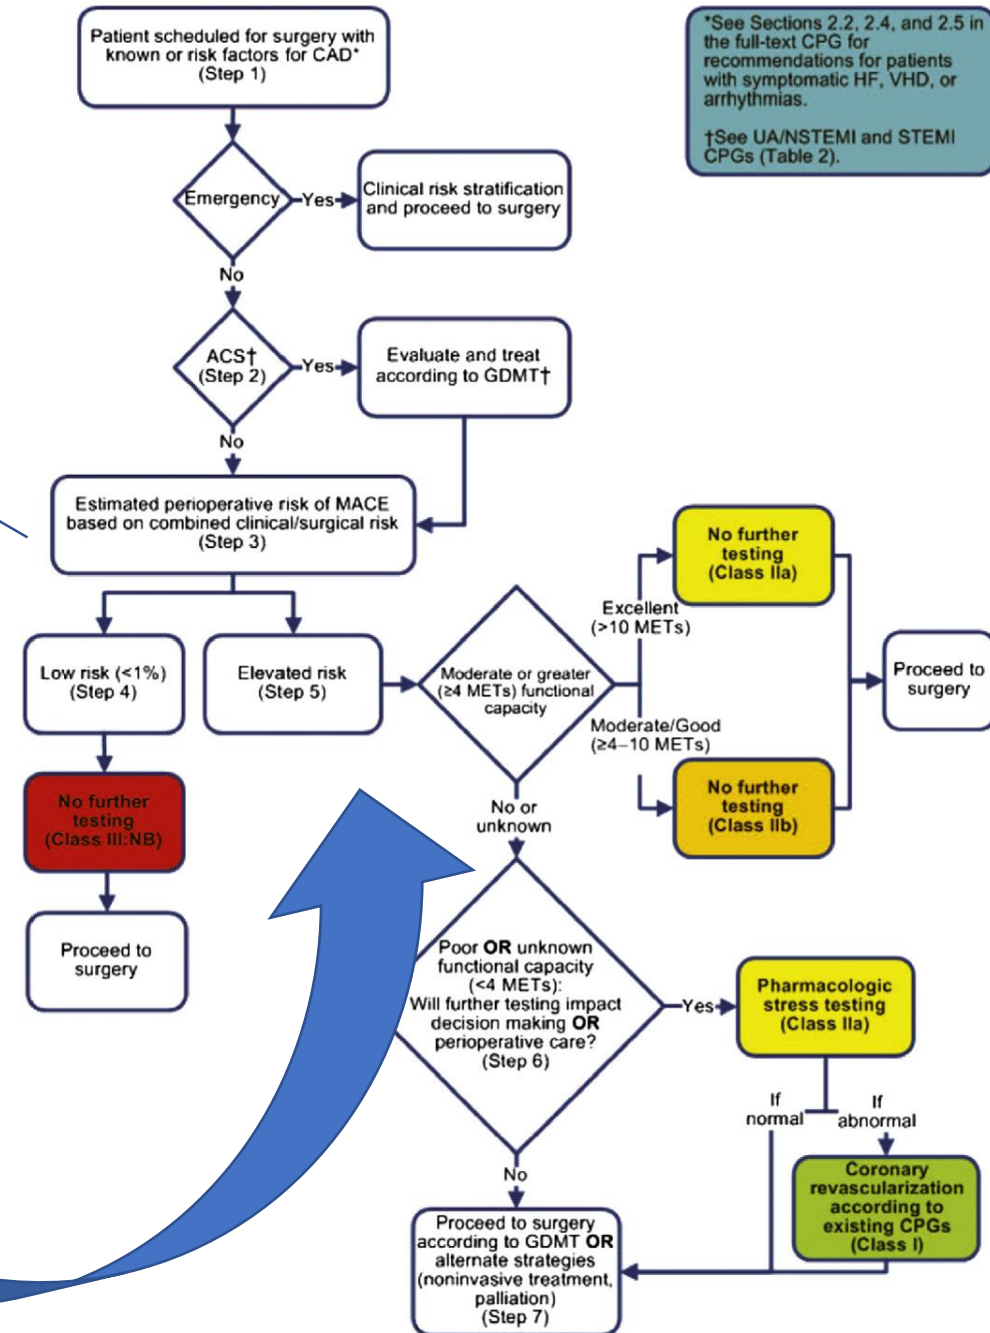

FIGURE 1. Stepwise Approach to Perioperative Cardiac Assessment for CABG.

# METS

- “Too subjective”

Table 3. Measures of Functional Capacity

## <4 METs

- Eat, dress, and use the toilet
- Walk indoors around the house
- Walk 1 or 2 blocks slowly (2–3 mph)
- Do light work around the house

## ≥4 METs

- Walk 4 mph or faster on level ground
- Climb a flight of stairs
- Walk up a hill
- Run a short distance
- Do heavy work around the house
- Golf
- Doubles tennis

MET = metabolic equivalent.

# Assessment of functional capacity before major non-cardiac surgery: an international, prospective cohort study

Duminda N Wijeyesundera, Rupert M Pearse, Mark A Shulman, Tom E F Abbott, Elizabeth Torres, Althea Ambosta, Bernard L Croal, John T Granton, Kevin E Thorpe, Michael P W Grocott, Catherine Farrington, Paul S Myles, Brian H Cuthbertson, on behalf of the METS study investigators

## Summary

**Background** Functional capacity is an important component of risk assessment for major surgery. Doctors' clinical subjective assessment of patients' functional capacity has uncertain accuracy. We did a study to compare preoperative subjective assessment with alternative markers of fitness (cardiopulmonary exercise testing [CPET], scores on the Duke Activity Status Index [DASI] questionnaire, and serum N-terminal pro-B-type natriuretic peptide [NT pro-BNP] concentrations) for predicting death or complications after major elective non-cardiac surgery.

**Interpretation** Subjectively assessed functional capacity should not be used for preoperative risk evaluation. Clinicians could instead consider a measure such as DASI for cardiac risk assessment.

*Lancet* 2018; 391: 2631–40

# DASI

Figure 8. Duke Activity Status Index

Item	Activity	Yes	No
1	Can you take care of yourself (eating, dressing, bathing, or using the toilet)?	2.75	0
2	Can you walk indoors, such as around your house?	1.75	0
3	Can you walk a block or 2 on level ground?	2.75	0
4	Can you climb a flight of stairs or walk up a hill?	5.5	0
5	Can you run a short distance?	8	0
6	Can you do light work around the house like dusting or washing dishes?	2.7	0
7	Can you do moderate work around the house like vacuuming, sweeping, floors, or carrying in groceries?	3.5	0
8	Can you do heavy work around the house like scrubbing floors or lifting and moving heavy furniture?	8	0
9	Can you do yard work like raking leaves, weeding, or pushing a power mower?	4.5	0
10	Can you have sexual relations?	5.25	0
11	Can you participate in moderate recreational activities like golf, bowling, dancing, doubles tennis, or throwing a baseball or football?	6	0
12	Can you participate in strenuous sports like swimming, singles, tennis, football, basketball, or skiing?	7.5	0

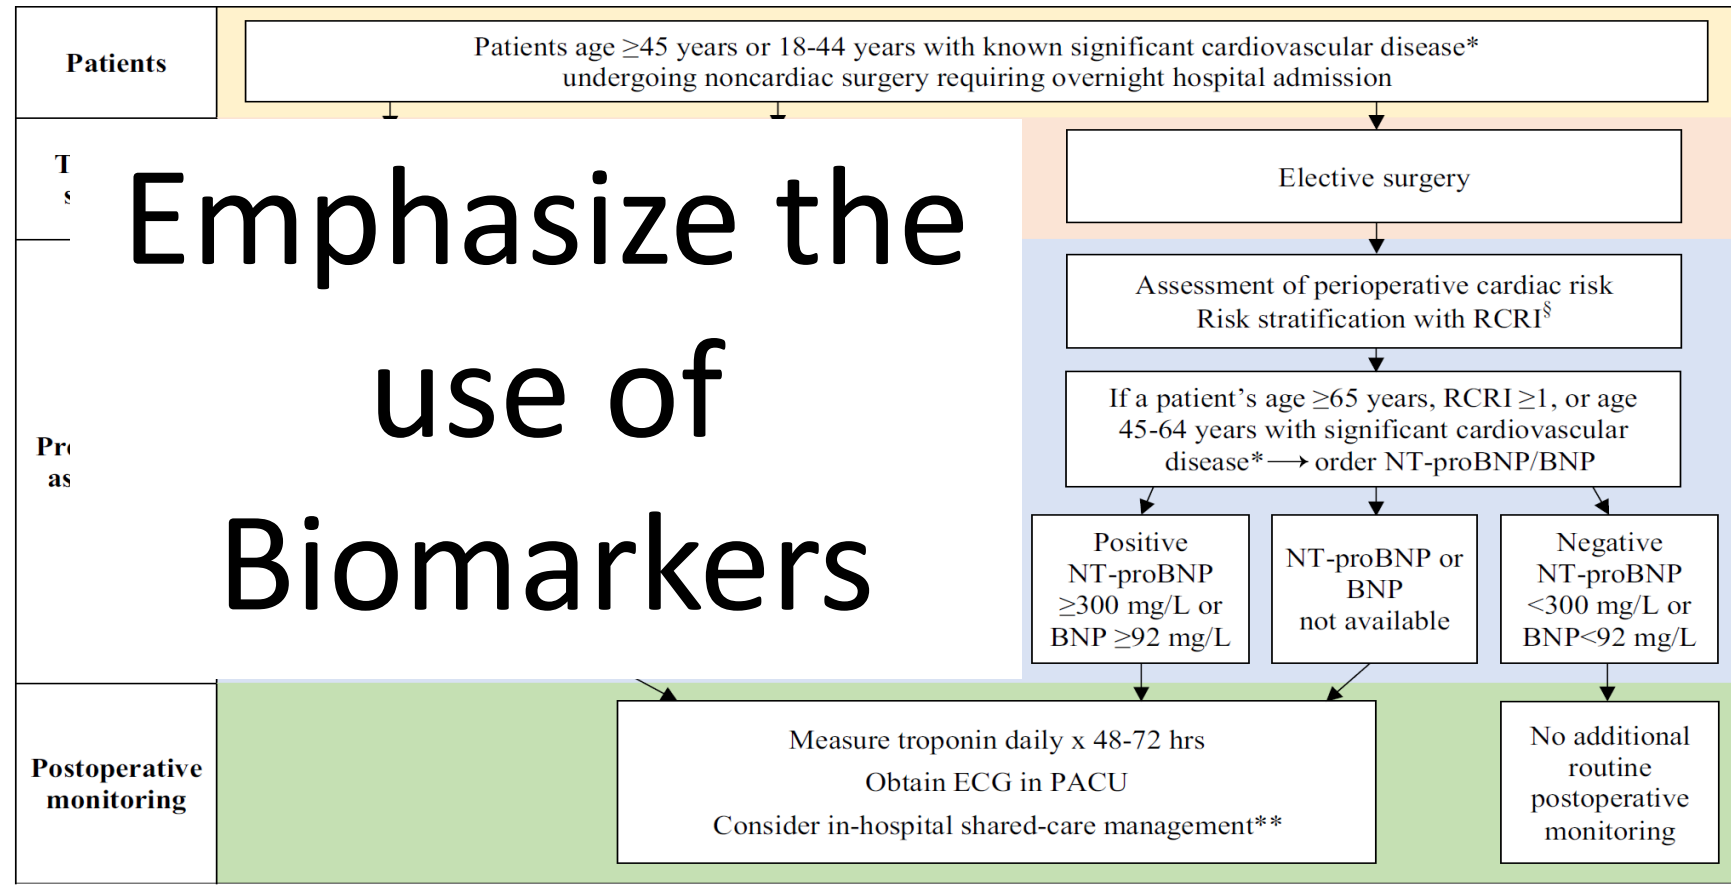

Duke Activity Status Index = SUM (values for all 12 questions).  
Hlatky et al. *Am J Cardiol*. 1989.<sup>21</sup>

To convert the DASI to METs, divide the sum value of all 12 questions of the DASI by 3.5.

# **Comparison of 4 Cardiac Risk Calculators in Predicting Postoperative Cardiac Complications After Noncardiac Operations**

Steven L. Cohn, MD<sup>a,b,\*</sup>, and Nerea Fernandez Ros, MD, PhD<sup>c</sup>

The 2014 American College of Cardiology/American Heart Association Perioperative Guidelines suggest using the Revised Cardiac Risk Index, myocardial infarction or cardiac arrest, or American College of Surgeons—National Surgical Quality Improvement Program calculators for combined patient-surgical risk assessment. There are no published data comparing their performance. This study compared these risk calculators and a reconstructed Revised Cardiac Risk Index in predicting postoperative cardiac complications, both during hospitalization and 30 days after operation, in a patient cohort who underwent select surgical procedures in various risk categories. Cardiac complications occurred in 14 of 663 patients (2.1%), of which 11 occurred during hospitalization. Only 3 of 663 patients (0.45%) had a myocardial infarction or cardiac arrest. Because these calculators used different risk factors, different outcomes, and different durations of observation, a true direct comparison is not possible. We found that all 4 risk calculators performed well in the setting they were originally studied but were less accurate when applied in a different manner. In conclusion, all calculators were useful in defining low-risk patients in whom further cardiac testing was unnecessary, and the myocardial infarction or cardiac arrest may be the most reliable in selecting higher risk patients. © 2017 Elsevier Inc. # A New Index for Pre-Operative Cardiovascular Evaluation

## ABSTRACT

**BACKGROUND** Currently used indices for pre-operative cardiovascular evaluation are either powerful, but complex, or simple, but with weak discriminatory power.

**OBJECTIVES** This study sought to prospectively derive and validate a simple powerful index that can stratify the cardiovascular risk of patients undergoing noncardiac surgery.

**METHODS** The derivation cohort consisted of 3,284 prospectively enrolled adult patients undergoing noncardiac surgery at the American University of Beirut Medical Center. The validation cohort consisted of 1,167,414 patients registered in the American College of Surgeons National Surgical Quality Improvement Program database. The primary outcome measure was death, myocardial infarction, or stroke at 30 days after surgery.

**RESULTS** The primary outcome occurred in 38 patients (1.2%) in the derivation cohort. Multivariate logistic regression analysis in the derivation cohort identified 6 data elements to be included in the prediction model: age  $\geq 75$  years, history of heart disease, symptoms of angina or dyspnea, hemoglobin  $< 12$  mg/dL, vascular surgery, and emergency surgery. Each patient was assigned a Cardiovascular Risk Index (CVRI) of 0, 1, 2, 3, and  $> 3$  based on the number of data elements present. The incidence of the primary outcome increased steadily across the CVRI groups in both the derivation (0%, 0.5%, 2.0%, 5.6%, and 15.7%, respectively;  $p < 0.0001$ ) and validation (0.3%, 1.6%, 5.6%, 11.0%, and 17.5%, respectively;  $p < 0.0001$ ) cohorts. The discriminatory power of the new CVRI was further confirmed by constructing a receiver-operating characteristic curve that had an area under the curve of 0.90 in the derivation cohort and 0.82 in the validation dataset.

**CONCLUSIONS** This study reports a new index for pre-operative cardiovascular evaluation which has a strong discriminatory power that can effectively stratify patients into low- (CVRI 0 to 1), intermediate- (CVRI 2 to 3), and high-risk (CVRI  $> 3$ ) groups. This has important implications for the efficient triage and management of patients scheduled for noncardiac surgery. (J Am Coll Cardiol 2019;73:3067-78) © 2019 by the American College of Cardiology Foundation.

# AUB-POCES study

## American University of Beirut–Pre-Operative Cardiovascular Evaluation Study

The American University of Beirut Pre-Operative Cardiovascular Evaluation Study prospectively derived and validated a new preoperative cardiovascular risk index, referred to as **CVRI**.

Six risk factors were identified in multivariate analysis:

- age  $\geq 75$  years,
- hemoglobin  $< 12$  mg/dL,
- history of heart disease,
- symptoms of angina or dyspnea,
- **vascular surgery, and**
- **emergency surgery**

# Cardiac Risk

## Cardiac Risk Scoring System

RCRI <https://www.mdcalc.com/revised-cardiac-risk-index-pre-operative-risk>

NSQIP <Http://riskcalculator.facs.org/RiskCalculator/PatientInfo.jsp>

Gupta MICA <http://www.surgicalriskcalculator.com/miorcardiacarrest>

VSGNE <https://qxmd.com/vascular-study-group-new-england-decision-support-tools>

# Gupta MICA

- Type of surgery
- Dependent functional status
- Abnormal creatinine,  $> 1.5$  mg/dL
- ASA Class
- Age

# Preoperative Cardiac Risk Calculators

- RCRI still standard but perhaps would use another calculator for vascular surgery:
  - Can use MICA, NSQIP, VSGNE CRI, AUB-POCES CRI
  - Note the RCRI indicators:
    - Insulin requiring DM (development several antidiabetic medications since 1999)
    - Creatinine > 2.0 (Perhaps eGFR or eCr Cl is more precise)
- Expect online calculators to become the standard
  - Value of being surgery specific, however
  - Most are not validated
  - NSQIP is adjusted periodically

## Other Preoperative Risk Calculators

# Pulmonary Complications

- Gupta Pneumonia
- Gupta Respiratory Failure
- ARISCAT Respiratory Failure
- STOPBANG Extended

# Perioperative Pulmonary Risk Calculators

<b>Gupta Pneumonia Risk</b>	<a href="http://www.surgicalriskcalculator.com/postoperative-pneumonia-risk-calculator"><u>http://www.surgicalriskcalculator.com/postoperative-pneumonia-risk-calculator</u></a>

<b>Scoring criteria:</b>		
<b>Low risk of OSA:</b> Yes to 0 to 2 questions		
<b>Intermediate risk of OSA:</b> Yes to 3 to 4 questions		
<b>High risk of OSA:</b> Yes to 5 to 8 questions or Yes to 2 or more of 4 STOP questions + male gender or Yes to 2 or more of 4 STOP questions + BMI >35kg/m <sup>2</sup> or Yes to 2 or more of 4 STOP questions + neck circumference 17 inches/43 cm in male or 16 inches/41 cm in female		

# OSA/OHS Algorithm

## Ambulatory versus inpatient surgery for patients with known OSA or suspected OSA

### STOP-Bang questionnaire (enhanced)

#### STOP:

- Snoring loudly
- Tiredness during the day
- Observed stopped breathing or choking/gasping during sleep
- High blood pressure

#### Bang:

- BMI >35 kg/m<sup>2</sup>
- Age >50 years
- Neck circumference ≥17 inches in males, ≥16 inches in females
- Gender male

#### Scoring:

- OSA low risk:
  - Yes to 0 to 2 questions
- OSA intermediate risk:
  - Yes to 3 or 4 questions
- OSA high risk:
  - Yes to ≥5 questions
  - OR Yes to ≥2 STOP + gender male
  - OR yes to ≥2 STOP + BMI >35 kg/m<sup>2</sup>
  - OR yes to ≥2 STOP + neck circumference ≥17 inches in males, ≥16 inches in females

# Frailty & Cognition: Perioperative Impact

# Frailty

Frailty, the loss of resilience with increased vulnerability to stressors, is independently associated with

- greater risk for postoperative complications,
- increased length of hospital stay, and
- greater likelihood of being discharged being dependent for care.

# Frailty Calculators

Frailty tool	Type	Time to administer	Tool components	Frailty definition	Advantages	Disadvantages
<b>Fried frailty phenotype</b>	observational	5-10 min	Weight loss, exhaustion, weakness, gait, low physical activity.	1-2 = pre-frail, 3 or more = frail	Extensively validated, predictive of outcomes, can be extracted from a health questionnaire.	Requires special equipment and patient participation.
<b>Frailty index</b>	self-reported	20-30 min	Accumulated symptoms, signs, diseases, and disabilities.	A dimensionless fraction with cut-off greater than ~0.25	validated, predictive.	Requires a long time to complete.
<b>Modified frailty index</b>	self-reported	10-15 min	List of co-morbidities and conditions.	Similar to frailty Index.	Shorter than frailty index.	Not as reliable/ predictive as frailty index.
<b>FRAIL scale</b>	self-reported	5-10 min	Fatigue, resistance, ambulation, illness and loss of weight.	1-2 = pre-frail, 3 or more = frail	Simple, no training needed to administer.	Needs to be further validated.
<b>Risk analysis index</b>	self-reported	5-10 min	Age/cancer, co-morbidities, residence, ADLs, cognitive decline	Composite score of 0 to 81, cut-off greater than 16-21	Simple, performed by clinical staff	most questions are part of standard nursing interviews
<b>VESPA (short form)</b>	self-reported	10 min	Gender, ADLs, functional status, charlson comorbidity index, surgical complexity.	A dimensionless fraction with cut-off greater than ~0.25	Simple, performed by physician assistants	modest sensitivity for postoperative complications.
<b>Edmonton frailty scale</b>	observational/ self-reported	10-15 min	Cognition, hospitalisation, general health, independence, social support, medication, nutrition, mood, continence, timed up and go.	Composite score $\geq 8$ out of 17 = frail	App available for tablet or phone.	Older adults may not be familiar or comfortable with tablet/phone.
<b>Clinical frail scale</b>	observational	< 5 min	Clinical descriptors and pictographs.	$\geq 5$ out of 9 = frail	Simple, accompanied by a visual chart.	Gestalt, unclear reliability.
<b>ACS NSQIP</b>	electronic health record	5-10 min	Demographics, symptoms, diseases, conditions.	Provides predicted 30 days mortality and complications	Based on very large database, highly predictive.	Limited to 30 days outcomes.

**Fig 2.** Commonly used clinical tools to assess frailty. Clinical modalities that are commonly used to assess frailty in the preoperative population. Tools are different in the type of data components that are collected and the definition of frailty, which leads to different time burdens to administer the tool. #### ABSTRACT

**Importance:** Age has historically been used to predict negative post-surgical outcomes. The concept of frailty was introduced to explain the discrepancies that exist between patients' chronological and physiological age. The efficacy of the modified frailty index (mFI) to predict surgical risk is not clear.

**Objective:** We sought to synthesize the current literature to quantify the impact of frailty as a prognostic indicator across all surgical specialties.

**Data sources:** Pubmed and Cochrane databases were screened from inception to 1 January 2018.

**Study selection:** Studies utilizing the modified Frailty Index (mFI) as a post-operative indicator of any type of surgery. The mFI was selected based on a preliminary search showing it to be the most commonly applied index in surgical cohorts.

**Data extraction and synthesis:** Articles were selected via a two-stage process undertaken by two reviewers (AP and DS). Statistical analysis was performed in Revman (Review manager V5.3). The random-effects model was used to calculate the Risk Ratios (RR).

**Main outcome(s) and measure(s):** The primary outcomes: post-operative complications, re-admission, re-operation, discharge to a skilled care facility, and mortality.

**Results:** This meta-analysis of 16 studies randomizes 683,487 patients, 444,885 frail, from gastrointestinal, vascular, orthopedic, urogenital, head and neck, emergency, neurological, oncological, cardiothoracic, as well as general surgery cohorts. Frail patients were more likely to experience complications (RR 1.48, 95%CI 1.35–1.61;  $p < 0.001$ ), major complications (RR 2.03, 95%CI 1.26–3.29;  $p = 0.004$ ), and wound complications (RR 1.52, 95%CI 1.47–1.57;  $p < 0.001$ ). Furthermore, frail patients had higher risk of readmission (RR 1.61, 95%CI 1.44–1.80;  $p < 0.001$ ) and discharge to skilled care (RR 2.15, 95%CI 1.92–2.40;  $p < 0.001$ ). Notably, the risk of mortality was 4.19 times more likely in frail patients (95% CI 2.96–5.92;  $p < 0.001$ ).

**Conclusions:** and Relevance: This study is the first to synthesize the evidence across multiple surgical specialties and demonstrates that the mFI is an underappreciated prognostic indicator that strongly correlates with the risk of post-surgical morbidity and mortality. This supports that formal incorporation of pre-operative frailty assessment improves surgical decision-making.

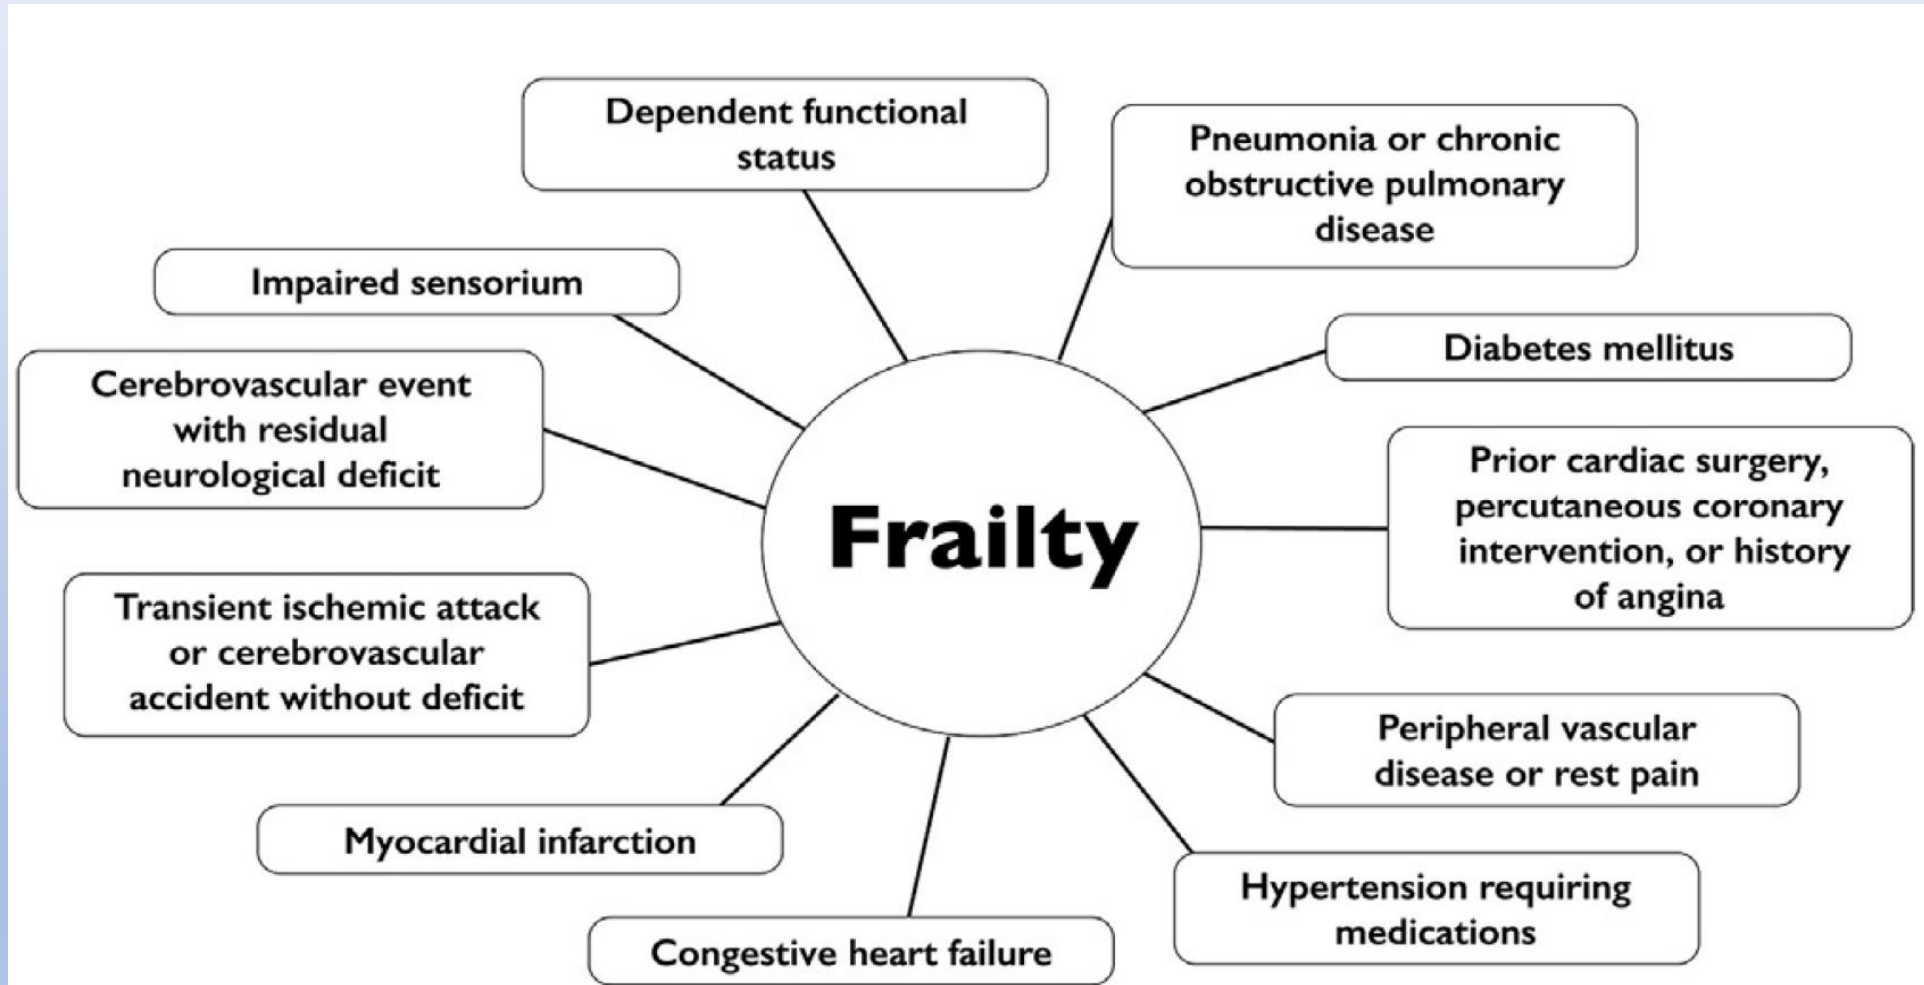

**Table 1**  
**Examples of factors included in the geriatric preoperative assessment**

Domain	Assessment	Follow-up/Implications of Low Scores
Cognition	Mini-Cog: clock draw and 3-item recall Montreal Cognitive Assessment	Delirium risk Decision-making potential Increased risk of nonhospital discharge Increased length of stay
Behavioral	Alcohol history Depression screening	Delirium risk Quality of life Decision making
Function	ADL Instruments ADL Timed up and go Walking speed	Increased risk of postoperative complications Increased mortality Delirium Preoperative exercise: prehabilitation opportunity
Polypharmacy	Medication list Screen for inappropriate medications	Delirium Readmission Morbidity/mortality
Nutrition	Albumin/prealbumin levels Mini-nutritional short form assessment	Preoperative nutrition supplements Increased risk of postoperative complications
Frailty	Phenotype: weight loss/grip strength/exhaustion/gait speed/low physical activity	Preoperative nutrition supplements Increased risk of postoperative complications Prehabilitation opportunity Treatment decisions

# Modified Frailty Index – 11 (NSQIP)

**Fig. 1.** The eleven mFI variables.

# New 5-Factor Modified Frailty Index Using American College of Surgeons NSQIP Data

**BACKGROUND:** The modified frailty index (mFI-11) is a NSQIP-based 11-factor index that has been proven to adequately reflect frailty and predict mortality and morbidity. These 11 factors, made of 16 variables, map to the original 70-item Canada Study of Health and Aging Frailty Index. In past years, certain NSQIP variables have been removed from the database; as of 2015, only 5 of the original 11 factors remained. The predictive power and usefulness of these 5 factors in an index (mFI-5) have not been proven in past literature. The goal of our study was to compare the mFI-5 to the mFI-11 in terms of value and predictive ability for mortality, postoperative infection, and unplanned 30-day readmission.

**STUDY DESIGN:** The mFI was calculated by dividing the number of factors present for a patient by the number of available factors for which there were no missing data. Spearman's rho was used to assess correlation between the mFI-5 and mFI-11. Predictive models, using both unadjusted and adjusted logistic regressions, were created for each outcome for 9 surgical subspecialties using 2012 NSQIP data, the last year all mFI-11 variables existed.

**RESULTS:** Correlation between the mFI-5 and mFI-11 was above 0.9 across all surgical specialties except for cardiac and vascular surgery. Adjusted and unadjusted models showed similar c-statistics for mFI-5 and mFI-11, and strong predictive ability for mortality and postoperative complications.

**CONCLUSIONS:** The mFI-5 and the mFI-11 are equally effective predictors in all sub-specialties and the mFI-5 is a strong predictor of mortality and postoperative complications. It has credibility for future use to study frailty within the NSQIP database. It also has potential in other databases and for clinical use. # Modified Frailty Index (NSQIP)

## **mFI-11**

1. Diabetes mellitus
2. Functional status (Not independent)
3. COPD or Pneumonia
4. CHF
5. Hypertension on medications
6. Myocardial Infarction
7. Prior Percutaneous Coronary Procedure or Angina
8. Peripheral Vascular Disease
9. Impaired Sensorium
10. TIA or CVA
11. Neurologic Deficit after prior CVA

## **mFI-5 (Changed in 2015)**

- 1 DM (either IDDM, or NIDDM)
- 2 Partially or Totally dependent functional status
- 3 COPD or Pneumonia
- 4 Congestive Heart Failure within 30 days
- 5 HTN requiring medication

# Geriatric Surgery Quality Improvement Program

Patients with dementia were found to have a higher incidence of several postoperative complications:

- acute renal failure (OR 1.32, 95% CI 1.19–1.47),
- pneumonia (OR = 2.18, 95% CI 1.69–1.92),
- septicemia (OR = 1.8, 95% CI 1.69–1.92),
- stroke (OR = 1.51, 95% CI 1.43–1.6), and
- urinary tract infection (OR = 1.62, 95% CI 1.5–1.74).

## 5.6 Geriatric Vulnerability Screens

Geriatric  
Surgery Verification

QUALITY IMPROVEMENT PROGRAM

A QUALITY PROGRAM  
of the AMERICAN COLLEGE  
OF SURGEONS

### Optimal Resources for Geriatric Surgery

2019 Standards

### Definition and Requirements

Patients must be screened for the following high-risk characteristics to identify potential areas of vulnerability:

- Age  $\geq$  85 years
- Impaired cognition
- Delirium risk
- Impaired functional status
- Impaired mobility
- Malnutrition
- Difficulty swallowing
- Need for palliative care assessment

A positive screen in any category will designate the patient as “high risk.”

In **elective** settings, the screening must be conducted prior to the operation to allow for time to address identified positive screens.

In **non-elective** settings, the screening must be conducted prior to the operation,\* if possible, to flag areas of vulnerability that must be addressed within the 48-hour postoperative window, or as soon as is clinically appropriate.

*\*Often, the clinical situation will not allow for the completion of some or all preoperative vulnerability screens (for example, the patient cannot perform a mobility screen because they are immobilized due to a hip fracture). In these situations, information must be gathered from the patient, his or her family, or caregiver as appropriate.*

# Geriatric Surgery Program Preop Assessment (ACS)

- Assess **cognitive** ability and capacity to understand anticipated surgery
- Screen for **depression**
- Identify risk factors for postoperative **delirium**
- Screen **for alcohol and substance abuse/dependence**
- Perform **preoperative cardiac evaluation** according to 2014 ACC Guideline
- Identify **risk factors for postoperative pulmonary** complications
- Document **functional** status and history of **falls**
- Determine **frailty** score
- Assess patient's **nutritional** status
- Take an accurate and detailed **medication history** and consider adjustments for **polypharmacy**
- Determine patient's **family** and **social support system**
- Order appropriate preoperative diagnostic tests focused on the elderly
- Determine patient's **treatment goals and expectations**

# Geriatric American College of Surgeons

## ASSESSING BASELINE AND CURRENT FUNCTIONAL STATUS IN AMBULATORY PATIENTS

### Short Simple Screening Test for Functional Assessment<sup>21,85</sup>

Ask the patient the following four questions:

1. *Can you get out of bed or chair yourself?*
2. *Can you dress and bathe yourself?*
3. *Can you make your own meals?*
4. *Can you do your own shopping?*

### Interpretation of Functional Screening Test

- If NO to any of these questions, more in-depth evaluation should be performed, including full screening of ADLs and IADLs.
- Deficits should be documented and may prompt perioperative interventions (for example, referral to occupational therapy and/or physical therapy) and proactive discharge planning.

NOTE: Patient's responses may not be reliable in the presence of cognitive impairment or dementia.

Document deficits in vision, hearing, or swallowing.

Inquire about history of falls (*"Have you fallen in the past year?"*).

Evaluate the patient for limitations in gait and mobility and determine risk for falls.

# ASSESSING GAIT AND MOBILITY IMPAIRMENT AND FALL RISK IN AMBULATORY PATIENTS

## Timed Up and Go Test (TUGT)<sup>86-88</sup>

Patients should sit in a standard armchair with a line 10 feet in length in front of the chair. They should use standard footwear and walking aids and should not receive any assistance.

Have the patient perform the following commands:

1. Rise from the chair (if possible, without using the armrests)
2. Walk to the line on the floor (10 feet)
3. Turn
4. Return to the chair
5. Sit down again

## Interpretation of TUGT

Any person demonstrating difficulty rising from the chair or requiring more than 15 seconds to complete the test is at high risk for falls. Consider preoperative referral to physical therapy for more detailed gait assessment.

# Frailty Criteria

- Shrinkage (Weight Loss)
- Weakness
- Exhaustion
- Low Physical Activity
- Slowness

## Preoperative frailty assessment

Frailty criteria	Assessment	Score	Points																								
Shrinkage	Ask the patient: Have you unintentionally lost $\geq 10$ lbs in the past year? <b>Yes / No</b>	<i>If Yes, add 1 point</i>																									
Weakness (grip strength)	1. Ask the patient to hold dynamometer in dominant hand with arms parallel to their body without squeezing arms against their body. 2. Adjust the handle to ensure that the middle phalanx rests on the inner handle. 3. Ask the patient to squeeze the handle and record. 4. Perform three trials, and obtain the average value. Record results below:  Trial 1: _____ kg force Trial 2: _____ kg force Trial 3: _____ kg force <b>Average:</b> _____ kg force	Compare patient's average with the lowest 20th percentile by gender and BMI shown below: <table> <tr> <th colspan="2">Men</th><th colspan="2">Women</th></tr> <tr> <th>BMI</th><th>Kg force</th><th>BMI</th><th>Kg force</th></tr> <tr> <td><math>\leq 24</math></td><td><math>\leq 29</math></td><td><math>\leq 23</math></td><td><math>\leq 17</math></td></tr> <tr> <td>24.1 to 26</td><td><math>\leq 30</math></td><td>23.1 to 26</td><td><math>\leq 17.3</math></td></tr> <tr> <td>26.1 to 28</td><td><math>\leq 31</math></td><td>26.1 to 29</td><td><math>\leq 18</math></td></tr> <tr> <td><math>&gt; 28</math></td><td><math>\leq 32</math></td><td><math>&gt; 29</math></td><td><math>\leq 21</math></td></tr> </table> Add 1 point if the <b>average</b> falls within or below the above values	Men		Women		BMI	Kg force	BMI	Kg force	$\leq 24$	$\leq 29$	$\leq 23$	$\leq 17$	24.1 to 26	$\leq 30$	23.1 to 26	$\leq 17.3$	26.1 to 28	$\leq 31$	26.1 to 29	$\leq 18$	$> 28$	$\leq 32$	$> 29$	$\leq 21$	
Men		Women																									
BMI	Kg force	BMI	Kg force																								
$\leq 24$	$\leq 29$	$\leq 23$	$\leq 17$																								
24.1 to 26	$\leq 30$	23.1 to 26	$\leq 17.3$																								
26.1 to 28	$\leq 31$	26.1 to 29	$\leq 18$																								
$> 28$	$\leq 32$	$> 29$	$\leq 21$																								
Exhaustion	Ask the patient the following two questions: 1. How often in the last week did you feel that everything you did was an effort? _____ 2. How often in the last week did you feel that you could not get going? _____	<table> <tr> <th>0</th><th>1</th><th>2</th><th>3</th></tr> <tr> <td>Rarely or none of the time (&lt;1 day)</td><td>Some or a little of the time (1 to 2 days)</td><td>Moderate amount of the time (3 to 4 days)</td><td>Most of the time (&gt;4 days)</td></tr> </table> Add 1 point for a score of 2 or 3 for EITHER question	0	1	2	3	Rarely or none of the time (<1 day)	Some or a little of the time (1 to 2 days)	Moderate amount of the time (3 to 4 days)	Most of the time (>4 days)																	
0	1	2	3																								
Rarely or none of the time (<1 day)	Some or a little of the time (1 to 2 days)	Moderate amount of the time (3 to 4 days)	Most of the time (>4 days)																								
Low physical activity	Ask the patient the following four questions: 1. Can you get out of bed or chair yourself? <b>Yes / No</b> 2. Can you dress and bathe yourself? <b>Yes / No</b> 3. Can you make your own meals? <b>Yes / No</b> 4. Can you do your own shopping? <b>Yes / No</b>	Add 1 point for any <b>No</b> answer																									
Slowness	1. Ask the patient to stand up and walk toward the tape on the ground. 2. Using a stopwatch, record the time it takes for the patient to walk 15 feet. Record results below:  Trial: _____ seconds	<table> <tr> <th colspan="2">Men</th><th colspan="2">Women</th></tr> <tr> <th>Height</th><th>Time</th><th>Height</th><th>Time</th></tr> <tr> <td><math>\leq 173</math> cm</td><td><math>\geq 7</math> seconds</td><td><math>\leq 159</math> cm</td><td><math>\geq 7</math> seconds</td></tr> <tr> <td><math>&gt; 173</math> cm</td><td><math>\geq 6</math> seconds</td><td><math>&gt; 159</math> cm</td><td><math>\geq 6</math> seconds</td></tr> </table> Add 1 point if the trial time falls higher than the above values	Men		Women		Height	Time	Height	Time	$\leq 173$ cm	$\geq 7$ seconds	$\leq 159$ cm	$\geq 7$ seconds	$> 173$ cm	$\geq 6$ seconds	$> 159$ cm	$\geq 6$ seconds									
Men		Women																									
Height	Time	Height	Time																								
$\leq 173$ cm	$\geq 7$ seconds	$\leq 159$ cm	$\geq 7$ seconds																								
$> 173$ cm	$\geq 6$ seconds	$> 159$ cm	$\geq 6$ seconds																								
<b>Frailty score:</b>																											

Total the **number of points for each criterion** (the total should be 0 to 5) to determine the frailty score.

- 0 to 1: Not frail
- 2 to 3: Intermediate (pre-frail)
- 4 to 5: Frail

**If the patient is in the intermediate frail or frail categories, please notify the surgeon.**

BMI: body mass index.

# ACS Geriatric Program: Cognition

## COGNITIVE ASSESSMENT: MINI-COG

### Mini-Cog: 3 Item Recall and Clock Draw<sup>19</sup>

#### 1. GET THE PATIENT'S ATTENTION, THEN SAY:

*"I am going to say three words that I want you to remember now and later.*

*The words are       **Banana**                      **Sunrise**                      **Chair***

*Please say them for me now."*

Give the patient 3 tries to repeat the words. If unable after 3 tries, go to next item.

#### 2. SAY ALL THE FOLLOWING PHRASES IN THE ORDER INDICATED:

*"Please draw a clock in the space below. Start by drawing a large circle. Put all the numbers in the circle and set the hands to show 11:10 (10 past 11)."*

If subject has not finished clock drawing in 3 minutes, discontinue and ask for recall items.

#### 3. SAY: *"What were the three words I asked you to remember?"*

# ACS Geriatric Program: Cognition

## Interpretation of the Mini-Cog

### SCORING:

3 item recall (0-3 points):	1 point for each correct word
Clock draw (0 or 2 points):	0 points for abnormal clock 2 points for normal clock

### A NORMAL CLOCK HAS ALL OF THE FOLLOWING ELEMENTS:

All numbers 1–12, each only once, are present in the correct order and direction (clockwise) inside the circle.

Two hands are present, one pointing to 11 and one pointing to 2.

ANY CLOCK MISSING ANY OF THESE ELEMENTS IS SCORED ABNORMAL.  
REFUSAL TO DRAW A CLOCK IS SCORED ABNORMAL.

**Total Score of 0, 1, or 2 suggests possible impairment.**

**Total Score of 3, 4, or 5 suggests no impairment.**

If the patient has evidence of cognitive impairment on the Mini-Cog, consider a referral to a primary care physician, geriatrician, or mental health specialist.<sup>20,21</sup>

# Mini-Cog

- Cognitive impairment can be quickly assessed by several validated screening tools, one of which is the **Mini-Cog**, which consists of a **three-item recall** and **clock drawing exercise**.
- The Mini-Cog has low inter-observer variability and has been **validated in the geriatric surgery population**

# Scoring the Mini-Cog©

The Mini-Cog© is scored in two parts: 1) 3-item recall, and 2) clock drawing. These are added together for a total score.

## 3-Item Recall Score:

1 point for each word recalled without cues, for a 3-item recall score of 1, 2, or 3.

## Clock Drawing Score:

2 points for a normal clock or 0 (zero) points for an abnormal clock drawing. A normal clock must include all numbers (1-12), each only once, in the correct order and direction (clockwise). There must also be two hands present, one pointing to the 11 and one pointing to 2. Hand length is not scored in the Mini-Cog© algorithm.

Normal Clock

Abnormal Clock  
(abnormal hands)

Abnormal Clock  
(missing number)

# Preoperative Screening Tools

- Cardiac
  - Revised Cardiac Risk Index (RCRI)
  - Reconstructed RCRI
  - National Surgical Quality Improvement Program (NSQIP)
  - Gupta Myocardial Infarction-Cardiac Arrest Index (MICA)
  - AUB-POCES (CVRI)
- Pulmonary
  - Gupta Pneumonia Risk Index
  - Gupta Respiratory Failure Index
  - ARISCAT (Respiratory Failure)
  - STOPBANG
- Frailty
  - Cognition
  - Functional Status
  - Nutritional status

Which of the following cardiac risk indices does the 2014 American College of Cardiology guideline recommend using?

- A. Revised Cardiac Risk Index
- B. Gupta Myocardial Infarction-Cardiac Arrest Index
- C. NSQIP American College of Surgeons
- D. Either A or B
- E. Either A or C

According to the 2014 American College of Cardiology guideline on preoperative cardiac risk assessment, it is reasonable to consider preoperative stress testing if the patient has poor or unknown functional status and the risk of a major adverse cardiac event is:

- A. > 1%
- B. > 2%
- C. > 3%
- D. > 4%
