ACP does not support this measure. Although we support the concept behind this measure, independent patient, system, and practice variables (incomplete patient information, unavailable drug information, miscommunication of drug orders, and insufficient information flow) can impede the physician’s ability to document complete and accurate medication lists. Consequently, clinical judgements may be based on incomplete clinical information. Further, the burden of collecting this information for all visits, even brief acute care visits when medications were documented on a recent visit, likely exceeds benefit. Attestation for these visits may become routine but does not add value.
