ACP supports MIPS measure ID# 118 (NQF ID# 0066): “Coronary Artery Disease: Angiotensin Converter Enzyme-Inhibitor (ACE-I) or Angiotensin Receptor Blocker (ARB) Therapy—Diabetes or LVSD (LVEF <40%)” because implementation will likely promote appropriate use of ACE-I and ARB therapy in patients who are diagnosed with CAD, the developer cites clinical recommendations of the American College of Cardiology (ACC)/American Heart Association (AHA)/American College of Physicians (ACP) for the “Management of Stable Ischemic Heart Disease” to form the basis of the measure, the measure specifications are well-defined, and data collection is feasible and burden is acceptable for clinicians report this measure. While we support this measure, we note that the measure is close to being topped out. Performance data suggests that 81% of clinicians who reported this measure in 2014 adhere to the interventions described in the specifications.
