Walking in Our Patients’ Shoes—Toward Empathy, Well-being, and Better Patient Care

Mukta Panda, MD, MACP, FRCP, Well-being Champion, Tennessee Chapter, and Jeremy Lambert, M Div, MAC, BCC, Staff Chaplain and Educator, Erlanger Health System

The University of Tennessee College of Medicine added patient simulations to their residency curriculum to improve patient-physician communication and relationship skills, enabling sustainable holistic care and better health outcomes.

Objectives
• Expose the learner to the influence of the social determinants of health.
• Offer the learner experiential awareness of the challenges faced by patients and additional resources to utilize in their development of a patient’s treatment plan.
• Equip learner with additional skills to better communicate and understand their patients (empathy).
• Demonstrate the benefits of a collective “team” approach toward patient care (physician well-being).

Impact
• The simulations are actual patient cases that reveal challenges patients face and how social determinants of health affect compliance to treatment.
• The simulations are designed to be engaged as a team to build community and demonstrate the benefits of a collective joined in common cause: to combat isolation that can lead to burnout.
• The simulations require the learner to look at the expectations of the patient beyond discharge.
• The simulations offer humanistic perspectives that improve patient-physician communication and relationship skills.

Lessons Learned
After completing the simulations and discussions, all participants agreed that the patient simulations demonstrated how their assumptions affect patient care.

94% agreed that the simulations demonstrated how the patient’s living situation affects their compliance to treatment plans.

88% agreed that the simulations demonstrated the importance of social, spiritual, and general history to tailor treatment plans.

94% agreed that the simulations demonstrated the value of a multidisciplinary team approach to patient care.

94% agreed that the simulations demonstrated how their empathy might affect patient care.
